

PRELIMINARY DERMATOLOGY REPORT

Patient Ref:	anonymous	Date:	2024-01-01
Generated By:	HealthBuddy AI Scribe	Confidentiality:	Private Medical Record

CHIEF COMPLAINT

Skin lesions on multiple parts of the body

HISTORY OF PRESENT ILLNESS

The patient presented with concerns about skin lesions. Multiple images were reviewed, including one from an unspecified location and another from the leg. The patient inquired about the possibility of the same condition affecting both areas.

AUTOMATED VISUAL ANALYSIS (ALL SCANS)

Scan 1: Drug Eruption 47.7%, Vitiligo 33.7%, Actinic Keratosis 10.4%, Lupus 1.7%, Bullous 1.5%

DIFFERENTIAL DIAGNOSIS

Given the information and the single set of image analysis provided, the top hypotheses include Drug Eruption and Vitiligo, with Actinic Keratosis being a less likely but possible consideration. The appearance of lesions in multiple areas, such as the leg, could suggest a systemic condition like Drug Eruption or an autoimmune condition like Vitiligo. However, without additional image analyses for the lesion on the leg, it's challenging to definitively state if the conditions are the same.

SUGGESTED MANAGEMENT PLAN

A thorough physical examination, a detailed medical history, and possibly a biopsy or further diagnostic tests are recommended to determine the exact nature of the skin lesions and to guide appropriate treatment.

DISCLAIMER: This report is generated by AI. It is NOT a definitive diagnosis. All findings must be verified clinically.
