

PRELIMINARY DERMATOLOGY REPORT

Patient Ref:	anonymous	Date:	2024-01-01
Generated By:	HealthBuddy AI Scribe	Confidentiality:	Private Medical Record

CHIEF COMPLAINT

Skin lesions with rapid growth

HISTORY OF PRESENT ILLNESS

The patient presented with a skin lesion and provided an image for analysis. The initial image suggested a possible drug eruption or vitiligo. A second image from a different part of the body, specifically the leg, was provided, showing rapid growth, which raised concerns about the nature of the condition.

AUTOMATED VISUAL ANALYSIS (ALL SCANS)

Scan 1: Drug Eruption 47.7%, Vitiligo 33.7%, Actinic Keratosis 10.4%, Lupus 1.7%, Bullous 1.5%

DIFFERENTIAL DIAGNOSIS

Given the rapid growth of the lesion in the leg, differential diagnoses include drug eruption, vitiligo, and potentially more serious conditions such as lupus or bullous disease, although the latter two have lower predicted probabilities. The discrepancy between the initial concern for a reaction to medication and the rapid growth of the new lesion necessitates a thorough medical evaluation.

SUGGESTED MANAGEMENT PLAN

A dermatological examination is recommended to assess the lesions and determine the underlying cause. A biopsy may be necessary to rule out more serious conditions. The patient should be advised to monitor the lesions for any further changes and to report back to the dermatologist with any new developments.
